
Engineers. An Endangered Species.

American engineers are becoming extinct. The National Science Foundation reports that the number of science and engineering baccalaureates in 1996 will fall short of demand by 45,000. By the year 2010, the shortfall could reach 700,000.

We in the Westinghouse Electronic Systems Group are concerned. You should be, too. For more than 50 years, our engineers have pushed the limits of technology to build America's economy and safeguard our freedom.

But who will be tomorrow's experts? Today, Japan and Russia are both graduating more engineers than the United States.

During National Engineers Week, February 18-24, it is fitting that we ensure our future by starting to reverse this trend. This week, Westinghouse engineers are visiting schools in our plant communities to enlighten students on the challenges and rewards of the engineering profession.

But we're not just talking. We're doing something tangible to help the cause. Each year Westinghouse, through a variety of programs, contributes more than $4 million to help our nation's schools.

With President Bush announcing the quest for better math and science education in his State-of-the-Union address of January 31, our outreach program couldn't come at a better time.

But we can't do it alone. Students, if you are interested in science or math, ask questions and learn all you can. Please follow up on a lucrative and rewarding career. Parents and teachers, cultivate those who excel in math and science; don't let their ambition fade.

This is an important mission for all of us. Your future...your children's future...and, without question, our nation's future lies in your hands.

Richard A. Linder
President
Westinghouse Electronic Systems Group
