OHIO WOMAN'S WISH

For Tired, Weak, Nervous Women

Bellefontaine, Ohio.—"I wish every tired, weak, nervous woman could have Vinol, for I never spent any money in my life that did me so much good as that I spent for Vinol. I was weak, tired, worn out and nervous, and Vinol made me strong, well and vigorous after everything else had failed to help me, and I can now do my housework with pleasure."—Mrs. J. F. LAMBORN.

We guarantee Vinol for all weak, run-down, nervous, debilitated conditions.

WHAT IS

LAX-FOS

LAX-FOS IS AN IMPROVED CASCARA

A DIGESTIVE LAXATIVE

CATHARTIC AND LIVER TONIC

LAX-FOS is not a Secret or Patent Medicine but is composed of the following old-fashioned roots and herbs:

CASCARA BARK
BLUE FLAG ROOT
RHUBARB ROOT
BLACK ROOT
MAY APPLE ROOT
SENNA LEAVES
AND PEPSIN

In LAX-FOS the CASCARA is improved by the addition of these digestive ingredients making it better than ordinary CASCARA, and thus the combination acts not only as a stimulating laxative and cathartic but also as a digestive and liver tonic. Syrup laxatives are weak, but LAX-FOS combines strength with palatable, aromatic taste and does not gripe or disturb the stomach. One bottle will prove LAX-FOS is invaluable for Constipation, Indigestion or Torpid Liver. Price 50c.

AGRICULTURAL NEWS

Compiled by County Demonstrator Everett F. White.

Patrons of the Centreville milk-cooling station met at the office of County Agent White, in the courthouse, on Tuesday and formed a Centreville local of the Queen Annes County Dairymen's Association. The purpose of the organization of this local, like that at Price and at Sudlersville, is stated thus in its Constitution.

"This association is formed for the purpose of securing to dairymen and farmers a remunerative price for milk, and to foster, promote and protect the general interests of milk producers, by combining the intelligence and influence of members against imposition and fraud, as experience from time to time may prove needful; by bringing about greater uniformity and certainty in a winter price and a summer price for milk, and by establishing closer ties of business association among the members."

For membership in the Inter-States Milk Producers' Association, it is necessary that the Queen Annes Association have 150 members. About 115 members have been enlisted.

Soy Bean Information.

So many requests for information on soy beans have come in lately, and there seems to be such a great place that this crop can fill in the agriculture of Queen Annes county, especially during these times of very high priced dairy feeds, that it seems wise to devote this week's letter to a complete and full discussion of the soy bean.

The soy bean is a native of Eastern Asia, coming from China or Japan. In the United States it has been an important crop for only about 20 years.

It is large, upright, branching, and resembles a tall growing, hairy leaved, hairy-stemmed field bean. It grows from 1½ to 4 feet high. The short, hairy pods usually contain two or three seeds which are of various colors. They resemble peas more than beans, as they are short and round.

Soy beans are well adapted to our soils and like corn, thrive best on rich loam soils. But it will grow in poor soils and each year increases the fertility of the land by means of nodules on its roots. It endures drought and stands excessive moisture better than corn or cowpeas. They will not grow as well as cowpeas on poor, sandy soils, but far better than cowpeas on stiff clay soils.

Soy beans mature in from 70 to 150 days, making it possible to select varieties to fit any length of growing season.

Prepare As For Corn.

They require the same kind of preparation of seedbed as corn, and, as in the case of corn, it is better thoroughly to prepare the seedbed before planting than to depend upon cultivation for getting the soil in proper condition.

For seed production, soy beans should be sown in rows 24 to 36 inches apart, far enough to cultivate, and one bushel of seed will plant two or three acres. The planting may be done with a corn planter or with a drill regulated for planting two bushels of oats per acre and with the proper number of seed holes closed to give the desired distance apart. The plants should be about two inches apart in the row.

For hay production, soy beans should be sown broadcast, one and one-half bushels per acre; and for this purpose there is no implement better suited than the wheat drill. The seed should never be covered more than one inch, except in sandy soil, where they may be covered two inches.

Soy beans may be planted from any time after corn planting is finished until July 15, depending upon variety, location and purpose for which planted. For hay and seed it is best to plant the forepart of June, to insure good curing weather and time for the late varieties to mature seed before frost. For fall hog pasture, and for turning down as green manure, they may be planted up until July 15.

Inoculation of Seed.

But few soils are naturally inoculated for soy beans and, since they seldom thrive unless inoculated, it is necessary to inoculate whenever planting for the first time. To do this, 200 or 300 pounds of soil taken from a field which has grown them should be broadcasted over each acre before seeding and harrowed in immediately to prevent the bacteria from being killed by sunlight. Inoculation with artificial culture is not successful when the culture is applied and the beans allowed to dry before seeding. Much better results are obtained when the beans are planted before the inoculating culture has dried.

Cutting should be done when the pods are about mature; this will give a maximum yield and the stems will not have become too woody. They should never be cut until the dew is off in the morning; let the plants lay in the swath until the leaves are nearly dry; rake and leave in the windrow for a day or two; then cock up and leave in the field until well cured. They will cure much quicker than cow peas, as they have a hollow stem and thus dry out faster. Soy bean hay will stand more wet weather than probably any other kind of hay.

For Use As Silage.

For the silo, it is best to mix with some other crop. Three loads of corn run through the blower, followed by one load of soy beans, makes a palatable roughage and one that is rich in protein. The juices of the corn soften the soy bean stems. They can be used much riper than for hay, as they go into the silo without curing.

For seed, soy beans must, of course, be planted in rows and cultivated. They should be cut before all the beans are ripe to avoid loss by shattering; they must be handled with the dew on. They can be harvested with a binder or mower with side delivery attachment. Threshing may be done with a wheat thresher by reducing the cylinder speed to about one-half that for threshing wheat and keeping the separator speed at normal.

The following varieties are among the best of those adapted to the south: Wilson, Virginia, Cloud, Hope and Mammoth Yellow.

Soy bean hay resembles alfalfa hay very closely in percentage of protein and percentage of digestible nutrients:

Alfalfa hay—14.3 per cent protein.
Soy bean hay—15.4 per cent protein.

Digestible Nutrients.

	Protein	Carbo-hydrates	Fats
Soy bean hay	10.8	38.7	1.5
Alfalfa hay	11.0	39.6	1.2

Combined with sorghum or millet, the soy bean supplies one of the best grain feeds for the dairy. The forage produced by the soy bean is higher in protein than can be obtained from any annual crop of equal yield. Milk can be produced by feeding soy bean stover at less cost than when corn is used. The analysis of meal from soy beans shows at least 35 per cent protein, which compares favorably with linseed and cotton seed meal. Meal from soy beans has none of the bad effects of cotton seed meal. One bushel of bean meal is equal to two and one-half to three bushels of corn for pork or beef production. Being rich in protein, the beans are a most valuable addition to the home grown concentrates for balancing the ordinary carbohydrate rich ration.

COMMON CABBAGE WORM

CONTROL MEASURES PERFECTED WHICH GREATLY REDUCE LOSSES BY THIS INSECT.

The common cabbage worm, the most destructive insect enemy of cabbage and related crops in the United States, begins its depredations as soon as the young plants are set out in the spring. Steps to combat it should be taken at an equally early date, therefore, it is pointed out in Farmers' Bulletin 766 of the United States Department of Agriculture. The Common Cabbage Worm, by F. H. Chittenden.

Although the insect caused the total destruction of cabbage, cauliflower and other crops in large areas in the years immediately after its first appearance in this country in the sixties, control measures have now been perfected to such a degree and adopted to such an extent that losses need not be great. Spraying with a solution of 2 pounds of arsenate of lead in the paste form or 1 pound of Paris green to 50 gallons of water should be begun as soon as the plants are set out and should be repeated as often as examination of the plants shows it to be necessary.

The common cabbage "worm" is the larva of a white butterfly having black tipped wings. The butterflies appear on warm spring days as early as March, even in the Northern States, and continue about gardens and fields until after several severe fall frosts. In the Gulf region they are present throughout the season. Eggs are laid on cabbage and related plants, where they hatch in from four to eight days.

The caterpillar is velvety green, about the color of the cabbage foliage. It eats voraciously and grows rapidly, becoming full grown in from 10 to 14 days after hatching. Three generations occur each season in the Northeast and probably six in the extreme South. The first generation usually develops on wild plants.

Hand picking may be practiced successfully in small gardens. Where sprays are employed they should be applied in a fine mist, since coarser applications tend to gather in drops on the leaves and run off.

Community action in combating the cabbage worm is desirable wherever cabbage and related crops are grown extensively. Agreements should be entered into by the truckers of the community for each to spray throughout the season and to clean carefully the fields of the bulk of the old stocks as soon as the crop is harvested. A few stalks should be left at regular intervals as traps in which the last generation of female butterflies will deposit eggs. Such stalks should be poisoned freely with arsenicals so that the worms of the last generation will not develop.

BIG POTATO PROFITS.

Five thousand dollars net profits from 50 acres of potatoes during the last year is the record made by Robert W. Knight, tenant on the Allan Cunningham farm, near Dover, Del. The 17,500 baskets of potatoes produced were sold for 76 cents per bushel; a few weeks before potatoes rose to one dollar per bushel.

The land on which the record crop was grown had never produced over $500 worth of farm products in any previous year. The land was cut both ways, plowed six inches deep and fertilized heavily. Choice seed potatoes were used and the crop sprayed and handled throughout the season.

A large drop of milk will adhere to a needle dipped into it and withdrawn, if pure, but if adulterated it will form several drops, which will leave the metal quickly.

Ford

THE UNIVERSAL CAR

320,817

Have been built and actually delivered to retail buyers since August 1st, 1916. These figures—320,817—represent the actual number of cars manufactured by us since August 1st, 1916 and delivered by our agents to retail buyers.

This unusual fall and winter demand for Ford cars makes it necessary for us to confine the distribution of cars only to those agents who have orders for immediate delivery to retail customers, rather than to permit any agent to stock cars in anticipation of later spring sales.

We are issuing this notice to intending buyers that they may protect themselves against delay or disappointment in securing Ford cars. If therefore, you are planning to purchase a Ford car, we advise you to place your order and take delivery now.

Immediate orders will have prompt attention.

Delay in ordering at this time may cause you to wait several months.

Enter your order today for immediate delivery and don't be disappointed later on. Prices: Runabout, $345; Touring Car, $360; Coupelet, $505; Town Car, $595; Sedan, $645; f. o. b. Detroit.
