The services and facilities of the Maryland State Department of Health and Mental Hygiene (DHMH) are operated on a non-discriminatory basis. This policy prohibits discrimination on the basis of race, color, sex, or national origin and applies to the provisions of employment and granting of advantages, privileges and accommodations.

The Department, in compliance with the Americans With Disabilities Act, ensures that qualified individuals with disabilities are given an opportunity to participate in and benefit from DHMH services, programs, benefits and employment opportunities.

DEFINITIONS AND EXPLANATORY NOTES

Data contained in this report are presented on a county of residence basis, regardless of where the vital event occurred, unless specifically noted otherwise. Birth, death and fetal death data include information for all Maryland residents, regardless of whether the birth or death occurred in Maryland or in the remainder of the United States. Information on marriages and divorces is limited to events occurring in Maryland.

DEFINITIONS

Age-adjustment: A methodology used to compare rates among populations with differing age distributions. The direct method of age-adjustment was used to calculate the rates in this report. Using this methodology, the crude death rate for each age group is multiplied by the proportion of the standard population within that age group; the sum of the products is the age-adjusted rate. Age-adjusted rates in this report are standardized to the projected 2000 U.S. population and are expressed as rates per 100,000 population. Publications prior to 1999 present adjustments to the 1940 standard U.S. population. **Age-adjusted rates should not be compared to crude rates or to adjusted rates calculated using a different standard population.** See page xiv for a discussion of the new standard.

Age-specific birth rate: Number of births to mothers of a specific age per 1,000 females in that age group.

Age-specific death rate: Number of deaths in a specific age group per 1,000 or 100,000 population in the same age group.

Crude birth rate: Number of live births per 1,000 population.

Crude death rate: Number of deaths from all causes per 1,000 or per 100,000 population. Death rates for specific causes are per 100,000 population.

General fertility rate: Total number of births per 1,000 females aged 15-44.

Fetal death*: Death before the complete expulsion or extraction from its mother of a product of human conception, irrespective of the duration of pregnancy; the death is indicated by the fact that after such separation, the fetus does not breathe or show any evidence of life, such as beating of the heart, pulsation of the umbilical cord or definite movement of voluntary muscles.

Fetal mortality rate*: Number of reportable* fetal deaths per 1,000 total births. Total births include live births plus fetal deaths of twenty or more weeks' gestation.

Infant death: Death occurring to a person under one year of age.

Infant mortality rate: Number of infant deaths per 1,000 live births.

Length of pregnancy: A measure of the duration of gestation in completed weeks as estimated by the attending physician.

Live birth*: The complete expulsion or extraction from its mother of a product of human conception, irrespective of the period of gestation, which, after such separation, breathes or shows any other evidence of life, such as beating of the heart, pulsation of the umbilical cord or definite movement of voluntary muscle, whether or not the umbilical cord has been cut or the placenta is attached.

Life expectancy: The average number of years of life remaining for an individual of a particular age group.

Low birth weight: A live birth weighing less than 2,500 grams (5.5 pounds).

Maternal death: Deaths due to pregnancy, childbirth and the puerperium (ICD-10 codes O00-O95, O98-O99, A34) occurring either during pregnancy or within 42 days of delivery or termination of pregnancy.

Maternal mortality rate: Number of maternal deaths per 100,000 live births.

Neonatal death: Death occurring to an infant under 28 days of age.

Neonatal mortality rate: Number of neonatal deaths per 1,000 live births.

Perinatal death: In this report, defined as the death of a fetus of 28 or more weeks' gestation or of an infant less than 7 days of age. Other commonly used definitions for perinatal death range from 20 to 28 weeks' gestation through seven to 28 days of life.

Perinatal death rate: In this report, defined as the number of perinatal deaths divided by the number of fetal deaths of 28 or more weeks' gestation plus the number of live births times 1,000. See perinatal death.

Postneonatal death: Death occurring to an infant between 28 days and one year of age.

Postneonatal mortality rate: Number of postneonatal deaths per 1,000 live births.

*The definitions of live birth and fetal death are set by law in Section 14 (a) of Article 43 of the Maryland Code, 1957 Edition – Supplement. Fetal deaths are reportable for filing purposes only if the death occurs after a period of gestation of twenty or more completed weeks (Section 21 (a) of Article 43 supra). Therefore, the fetal deaths included in this report are only those of twenty or more weeks gestation.

EXPLANATORY NOTES

Population

Between the decennial censuses, the Census Bureau, with the assistance of the Federal State Cooperative Program for Population Estimates (FSCPE), develops annual population estimates. These estimates use as their starting point data from the most recent decennial census (currently April 1, 2000). Estimates for each year are derived using data on resident births, resident deaths, net international immigration, internal migration and net movement of U.S. armed forces. Estimates by race, sex, age and Hispanic origin are prepared for all states and counties. Estimates are also available for certain subcounty areas. Further information on the preparation of population estimates may be found on the Census Bureau web site at <http://www.census.gov/popest/topics/methodology>.

The population estimates appearing in this report for Maryland and its political subdivisions are “bridged-race” estimates prepared by the National Center for Health Statistics (NCHS) in collaboration with the U.S. Census Bureau. These data were prepared in order to “bridge” population data for multiple race individuals back to single race categories, and to make racial categories consistent with pre-Census 2000 data. In 1997, the Office of Management and Budget (OMB) issued a new directive with regard to the collection of race data, and beginning with the 2000 U.S. Census, respondents were given the opportunity to identify themselves by more than one race. At the same time, the number of race categories increased from four (White; Black or African American; American Indian or Alaskan Native; and Asian or Pacific Islander) to five (American Indian or Alaskan Native; Asian; Black or African American; Native Hawaiian or Other Pacific Islander; and White). These changes increased the number of potential race categories from four to 31.

Since birth and death records in most states collect race information using pre-1997 OMB standards, the numerator (number of births or deaths) and denominator (population) data used to calculate vital statistics rates are not compatible. To address this issue, NCHS and the U.S. Census Bureau developed a method of “bridging” the 31 racial categories to the four single race categories used prior to Census 2000. This methodology was developed using information obtained from the National Health Interview Survey, in which respondents who chose more than one race were asked to also choose the single race with which they most closely identified. Further information pertaining to the preparation of bridged population data may be found on the NCHS web site at http://www.cdc.gov/nchs/nvss/bridged_race.htm.

Cause of Death

The tenth revision of the International Classification of Diseases (ICD-10) has been used to code the causes of death reported on death certificates since 1999. The ICD is a classification system for mortality data developed by the World Health Organization and other international centers to promote comparability in the collection, classification, processing and presentation of mortality statistics. The ICD-10 is periodically revised to reflect advances in medical science. ICD-10 replaced ICD-9, which was used with 1979-98 data.

ICD-10 differs substantially from ICD-9. ICD-10 includes expanded detail for many conditions, transfers conditions between classifications, incorporates the use of alphanumeric instead of numeric codes, modifies coding rules and modifies tabulation lists. Because of these changes, the presentation of mortality data by cause of death is substantially different, and discontinuities in trend data between ICD revisions are likely to exist for certain causes of death. To assist in bridging discontinuities in trends of causes of death between ICD revisions, the NCHS has prepared comparability ratios for 113 selected causes of death (see next section). Comparability ratios were prepared by double coding a national sample of 1996 deaths using both ICD-9 and ICD-10 coding. Preliminary comparability ratios for 113 Selected Causes of Death are shown on page xv of this report. These ratios were calculated by dividing the number of deaths attributed to a certain cause of death using ICD-10 coding by the number of deaths using ICD-9 coding. A ratio of 1.00 indicates that the same number of deaths was assigned to a particular cause of death using ICD-9 and ICD-10 coding. A ratio of less than 1.00 results from either a decline in the assignment of deaths to a cause in ICD-10 compared with ICD-9, or because a cause of death in ICD-10 is only a part of the ICD-9 revision title. For example, the comparability ratio for salmonella infections is 0.81, which indicates that 19% fewer deaths occur as a result of the introduction of the ICD-10 revision. This ratio is calculated by dividing the number of deaths in ICD-10 codes A01-A02 by the number of deaths in ICD-9 codes 002-003. A ratio of greater than 1.00 may result from an increase in deaths assigned to a particular cause in ICD-10, or because the ICD-10 revision title is broader than the ICD-9 title for a cause of death. An example would be septicemia, with a comparability ratio of 1.19. This ratio indicates that 19% more deaths occurred from this cause using ICD-10 coding than by using ICD-9 coding.

In order to compare trends, all age-adjusted rates for causes of death shown in this report for years earlier than 1999 have been adjusted to the tenth revision by multiplying the rate as it existed using the ninth revision by the comparability ratios described above and presented on page xv.

Additional information on ICD-10 may be obtained on the NCHS web site at <http://www.cdc.gov/nchs/icd.htm>.

Age-adjusted Death Rates

Beginning with data year 1999, all federal agencies adopted the year 2000 projected U.S. population as the new standard for age-adjusting death rates. The year 2000 population replaced at least three different population standards used in earlier years. The use of these multiple standards resulted in difficulties comparing data prepared by agencies using different standards, and caused confusion among data users. Use of the 2000 standard was recommended to promote uniformity of data among agencies and to eliminate the need to calculate mortality rates using more than one standard.

As described in page x of this report, age-adjustment is the process used to compare rates among populations with differing age distributions. Age-adjustment is used to eliminate the confounding effect of differences in age distributions among groups or over time.

Age-adjusted rates prepared using the year 2000 standard cannot be compared with rates calculated using other standards. Therefore, all age-adjusted rates for earlier years presented in the Maryland Vital Statistics Annual Report have been recalculated using the year 2000 standard population.

Further information about the year 2000 population standard may be downloaded from the NCHS website by clicking on “Year 2000 Population Standard for Age-Adjusting Death Rates in the United States” at <http://www.cdc.gov/nchs/data/dvs/IW134Pfct.pdf>.

***VITAL
STATISTICS
HIGHLIGHTS***

Highlights of 2008

Population

- The estimated **population** of Maryland in 2008 was 5,633,597, a slight increase from the 2007 estimate of 5,618,344.
- The distribution of the 2008 Maryland population was as follows: White (64.1%), Black or African-American (30.0%), Asian or Pacific Islander (5.4%) and American Indian (< 1%).
- Nearly seven percent of the population (6.7%) was comprised of individuals of Hispanic origin.

Life expectancy

- The **life expectancy** for an infant born in 2008 was 78.4 years. For whites, this figure was 79.5 years and for blacks, 75.0 years.

Births

- There were 77,268 **live births** to Maryland residents in 2008, a 1.0% decline over the number of births in 2007. The overall **birth rate** was 13.7 births per 1,000 population.
- The **birth rate** among women of Hispanic origin was 28.0 per 1,000 population, over twice the statewide average.
- Births to **teen mothers** accounted for 8.6% of all births. Nearly three percent (2.8%) of all births were to mothers under the age of 18.
- The **adolescent birth rate** dropped to 32.7 per 1,000 women ages 15-19 years in 2008, a 4.9% decrease from the 2007 rate of 34.4.

- Fifteen percent of births were to women who had completed fewer than 12 **years of education**.
- **Fourth and higher order births** accounted for 10.3% of all births in 2008, slightly higher than the 2007 figure of 10.2%.
- In terms of **area of occurrence**, approximately 92% of all births to Maryland residents occurred within the State. Six percent occurred in the District of Columbia and 2% in other states.
- The percentage of births to **unmarried women** continues to rise. In 2008 the figure was 42.3% overall, 33.4% for white women, 64.1% for black women, and 57.1% for Hispanic women.
- Eighty percent of live births were to women who began **prenatal care** during the first trimester of pregnancy, and 4.2% were to women who received late (third trimester) or no prenatal care.
- The incidence of **low birth weight** (birth weight <2500 grams) was 9.3% in 2008. This figure was 7.2% for white infants, 13.2% for black infants and 7.1% for Hispanic infants. The incidence of **very low birth weight** (birth weight <1500 grams) was 1.9% overall, 1.3% for whites, 3.2% for blacks and 1.4% for Hispanics.
- Eleven percent of infants were delivered earlier than 37 weeks **gestation**. This figure was 9.5% for whites, 13.9% for blacks and 9.4% for Hispanics.
- A total of 4.1% of births were twin or higher order in 2008. The rate of

multiple births has increased by 20% over the past decade. Nearly 60% of infants of multiple gestation pregnancies have birth weights below 2500 grams.

- A third of infants born in 2008 were delivered by **cesarean delivery**, similar to the 2007 figure of 33.6%. The number of infants delivered by cesarean section has increased by 44% over the past decade.

Fetal and infant deaths

- The **fetal death rate** in 2008 was 7.5 per 1,000 total deliveries. This figure was 4.9 for whites and 11.5 for blacks.
- The **infant mortality rate** was 8.0 per 1,000 live births in 2008, identical to the 2007 rate. The infant mortality rate was 5.2 among whites, 13.4 among blacks and 3.2 among Hispanics.
- The **neonatal mortality rate** was 5.8 per 1,000 live births in 2008, unchanged from the rates in 2006 and 2007. The rate was 3.6 among whites, 9.9 among blacks and 2.5 among Hispanics.
- The **postneonatal mortality rate** was 2.1 per 1,000 live births in 2008, slightly lower than the 2007 rate of 2.2. The rate was 1.5 among whites, 3.5 among blacks and 0.8 among Hispanics.

*Race and Hispanic origin are reported separately on the death certificate. Data for persons of Hispanic origin are included in the data for each race group according to the reported race of the decedent.

**Includes all deaths to persons of Hispanic origin of any race.

***Fetal death rates are per 1,000 total deliveries (live births plus fetal deaths).

****Rates based on fewer than five events in the numerator are not presented since such rates are likely to be unstable.
