DEFINITIONS AND EXPLANATORY NOTES

Data contained in this report are presented on a county of residence basis, regardless of where the vital event occurred, unless specifically noted otherwise. Birth, death and fetal death data include information for all Maryland residents, regardless of whether the birth or death occurred in Maryland, the remainder of the United States, or certain foreign countries that report vital event data to Maryland. Information on marriages and divorces is limited to events occurring in Maryland.

DEFINITIONS

Age-adjustment: A methodology used to compare rates among populations with differing age distributions. The direct method of age-adjustment was used to calculate the rates in this report. Using this methodology, the crude death rate for each age group is multiplied by the proportion of the standard population within that age group; the sum of the products is the age-adjusted rate. Age-adjusted rates in this report are standardized to the projected 2000 U.S. population and are expressed as rates per 100,000 population. Publications prior to 1999 present adjustments to the 1940 standard U.S. population. **Age-adjusted rates should not be compared to crude rates or to adjusted rates calculated using a different standard population.**

Age-specific birth rate: Number of births to mothers of a specific age per 1,000 females in that age group.

Age-specific death rate: Number of deaths in a specific age group per 1,000 or 100,000 population in the same age group.

Crude birth rate: Number of live births per 1,000 population.

Crude death rate: Number of deaths from all causes per 1,000 or per 100,000 population. Death rates for specific causes are per 100,000 population.

General fertility rate: Total number of births per 1,000 females aged 15-44.

Fetal death*: The death of a product of human conception, before its complete expulsion or extraction from the mother, regardless of the duration of the pregnancy, as indicated by the fact that, after the expulsion or extraction, the fetus does not breathe or show any other evidence of life, such as heart beat, pulsation of the umbilical cord, or definite movement of voluntary muscle.

Fetal mortality rate*: Number of reportable* fetal deaths per 1,000 total births. Total births include live births plus fetal deaths of twenty or more weeks' gestation.

Infant death: Death occurring to a person under one year of age.

Infant mortality rate: Number of infant deaths per 1,000 live births.

Length of pregnancy: A measure of the duration of gestation in completed weeks as estimated by the attending physician.

Live birth*: The complete expulsion or extraction of a product of human conception from the mother, regardless of the period of gestation, if, after the expulsion or extraction, it breathes or shows any other evidence of life, such as heart beat, pulsation of the umbilical cord, or definite movement of voluntary muscle, whether or not the umbilical cord is cut or the placenta is attached.

Life expectancy: The average number of years of life remaining for an individual of a particular age group.

Low birth weight: A live birth weighing less than 2,500 grams (5.5 pounds).

Maternal death: Deaths due to pregnancy, childbirth and the puerperium (ICD-10 codes O00-O95, O98-O99, A34) occurring either during pregnancy or within 42 days of delivery or termination of pregnancy.

Maternal mortality rate: Number of maternal deaths per 100,000 live births.

Neonatal death: Death occurring to an infant under 28 days of age.

Neonatal mortality rate: Number of neonatal deaths per 1,000 live births.

Perinatal death: In this report, defined as the death of a fetus of 28 or more weeks' gestation or of an infant less than 7 days of age. Other commonly used definitions for perinatal death range from 20 to 28 weeks' gestation through seven to 28 days of life.

Perinatal death rate: In this report, defined as the number of perinatal deaths divided by the number of fetal deaths of 28 or more weeks' gestation plus the number of live births times 1,000. See perinatal death.

Postneonatal death: Death occurring to an infant between 28 days and one year of age.

Postneonatal mortality rate: Number of postneonatal deaths per 1,000 live births.

*The definitions of live birth and fetal death are set by law in Section 14 (a) of Article 43 of the Maryland Code, 1957 Edition – Supplement. Fetal deaths are reportable for filing purposes only if the death occurs after a period of gestation of twenty or more completed weeks (Section 21 (a) of Article 43 supra). Therefore, the fetal deaths included in this report are only those of twenty or more weeks gestation.

EXPLANATORY NOTES

Population

Between the decennial censuses, the U.S. Census Bureau, with the assistance of the Federal State Cooperative Program for Population Estimates (FSCPE), develops annual population estimates. These estimates use as their starting point the most recent decennial census data (currently April 1, 2010). Estimates for each year are derived using data on resident births, resident deaths, net international immigration, internal migration and net movement of U.S. armed forces. Estimates by race, sex, age and Hispanic origin are prepared for all states and counties. Estimates are also available for certain subcounty areas. Further information on the preparation of population estimates may be found on the U.S. Census Bureau web site at <http://www.census.gov/popest/>.

The population figures appearing in this report for Maryland and its political subdivisions are “bridged-race” estimates prepared by the National Center for Health Statistics (NCHS) in collaboration with the U.S. Census Bureau. Since many states continue to collect race information on birth and death records using pre-2000 Census race categories, the numerator (number of births or deaths) and denominator (population) data used to calculate vital statistics rates are not compatible. To address this issue, NCHS and the U.S. Census Bureau developed a method for “bridging” the 31 racial categories used since Census 2000 to the four single race categories specified in earlier standards. This methodology was developed using information obtained from the National Health Interview Survey, in which respondents who chose more than one race were asked to also choose the single race with which they most closely identified. Further information pertaining to the preparation of bridged population data may be found on the NCHS web site at http://www.cdc.gov/nchs/nvss/bridged_race.htm.

Cause of Death

The tenth revision of the International Classification of Diseases (ICD-10) has been used to code the causes of death reported on death certificates since 1999. The ICD is a classification system for mortality data developed by the World Health Organization and other international centers to promote comparability in the collection, classification, processing and presentation of mortality statistics. The ICD-10 is periodically revised to reflect advances in medical science. ICD-10 replaced ICD-9, which was used with 1979-98 data.

ICD-10 differs substantially from ICD-9. ICD-10 includes expanded detail for many conditions, transfers conditions between classifications, incorporates the use of alphanumeric instead of numeric codes, modifies coding rules and modifies tabulation

lists. Because of these changes, the presentation of mortality data by cause of death is substantially different, and discontinuities in trend data between ICD revisions are likely to exist for certain causes of death. Additional information on the history of the classification of diseases and the causes of death may be found at http://www.cdc.gov/nchs/data/misc/classification_diseases2011.pdf.

Age-adjusted Death Rates

As described in page x of this report, age-adjustment is the process used to compare rates among populations with differing age distributions. Age-adjustment is used to eliminate the confounding effect of differences in age distributions among groups or over time.

Beginning with data year 1999, all federal agencies adopted the year 2000 projected U.S. population as the standard for age-adjusting death rates. The year 2000 population replaced at least three different population standards used in earlier years. The use of these multiple standards resulted in difficulties comparing data prepared by agencies using different standards, and caused confusion among data users. Use of the 2000 standard was recommended to promote uniformity of data among agencies and to eliminate the need to calculate mortality rates using more than one standard. All age-adjusted rates presented in the Maryland Vital Statistics Annual Report have been calculated using the year 2000 standard population. Age-adjusted rates prepared using the year 2000 standard cannot be compared with rates calculated using other standards.

Race and Hispanic Origin

Several charts and tables in this report show data categorized by race and Hispanic origin. It is important to note that Hispanic origin is an ethnicity classification and can occur concurrently with any race. All birth data in the report are based on the race and Hispanic origin of the mother. In cases of death data, the race and Hispanic origin of the decedent is used. Thus, data for individuals of Hispanic origin are displayed across race categories excluding those specified as “Non-Hispanic”. Alternatively, categories labeled “Hispanic” are inclusive of all persons of Hispanic origin regardless of reported race. Therefore, an overlap exists between categories labeled “Hispanic” and those which include data on Hispanic individuals organized by race.

***VITAL
STATISTICS
HIGHLIGHTS***

Highlights of 2015

Population

- The **population** of Maryland in 2015 was 6,006,401, a small increase over the 2014 population estimate of 5,976,407.

The largest decline occurred among black males, whose life expectancy fell from 74.2 years in 2014 to 73.4 years in 2015.

Births

- There were 73,544 **live births** to Maryland residents in 2015, similar to the number of births occurring in 2014.
- The overall **birth rate** was 12.2 births per 1,000 population. The **birth rate** for women of Hispanic origin was 20.5 per 1,000 population, double the rate for Non-Hispanic white women.
- Births to **teen mothers** accounted for 4.4% of all births. One percent of all births were to mothers under the age of 18.
- The **adolescent birth rate** dropped to 16.9 per 1,000 women ages 15-19 years in 2015, a 5.1% decline from the 2014 rate of 17.8. The overall rate has

fallen by 49.7% over the past decade.

- Thirteen percent (12.9%) of births were to women who had completed fewer than 12 **years of education**. Nearly half (43.9%) of all Hispanic births were to mothers with fewer than 12 years of education.
- Fourth and higher order births accounted for 10.7% of all births in 2015, similar to the 2014 rate of 10.5%.
- In terms of **area of occurrence**, over 91% of all births to Maryland residents occurred within the state. Nearly 6% occurred in the District of Columbia and approximately 2% in other states.
- Forty percent of all births were to **unmarried women**. This figure was 24.7% for Non-Hispanic white women, 61.2% for Non-Hispanic black women and 54.7% for Hispanic women. The number of births to unmarried women has been decreasing since 2009.
- Sixty-two percent of live births were to women who began **prenatal care** during the first trimester of pregnancy, and 8.3% were to women who received late (third trimester) or no prenatal care. Non-Hispanic Black women were twice as likely to receive late or no prenatal care as Non-Hispanic white women.
- The incidence of **low birth weight** (birth weight <2,500 grams) remained at 8.6% in 2015. The percentage of low birth weight infants was 6.8% for white infants, 12.1% for black infants and 7.3% for Hispanic infants. The incidence of **very low birth weight** (birth weight <1,500 grams) was 1.7% overall, 1.1% for whites, 2.8% for blacks and 1.3% for Hispanics.
- Ten percent of infants were delivered prior to 37 completed weeks of

gestation. This figure was 8.9% for whites, 12.5% for blacks and 9.1% for Hispanics.

- Twin, triplet and higher order multiple births accounted for 3.5% of total births in 2015. Over half of infants of multiple gestation pregnancies had birth weights below 2,500 grams (56.5%).
- Nearly thirty-five percent of infants born in 2015 were delivered by **cesarean delivery**. The percentage of infants delivered by cesarean section has increased by 14% over the past decade.

Fetal and infant deaths

- The **fetal death rate** in 2015 was 7.1 per 1,000 total deliveries, compared to a rate of 7.6 in 2014. The rate was 5.4 for whites and 12.0 for blacks.
- The **infant mortality rate** was 6.7 per 1,000 live births in 2015, a 3% increase over the 2014 rate of 6.5. The rate was 4.0 among Non-Hispanic whites, 11.3 among Non-Hispanic blacks and 5.5 among Hispanics.
- The **neonatal mortality rate** was 4.9 per 1,000 live births in 2015, compared to a rate of 4.6 in 2014. The rate was 2.7 among Non-Hispanic whites, 7.7 among Non-Hispanic blacks and 4.1 among Hispanics.
- The **postneonatal mortality rate** was 1.8 per 1,000 live births in 2015, a 5.3% decline from the rate of 1.9 in 2014. The rate was 1.3 among Non-Hispanic whites, 2.8 among Non-Hispanic blacks and 1.4 among Hispanics.

Deaths

- There were 47,235 **deaths** among Maryland residents in 2015, compared with 45,688 in 2014.

- The **crude death rate** was 786.4 per 100,000 population in 2015, compared with 764.5 in 2014.
- **Age-specific death rates** increased between 2014 and 2015 for most age groups under 55 years. Rates declined among the 65-74 and 75-84 year age groups.
- The overall **age-adjusted mortality rate** was 705.6 per 100,000 population in 2015, compared with a rate of 696.8 in 2014.
