

Maryland Historical Trust

Maryland Inventory of Historic Properties number: CAROL 156

Name: PEARCE RD. OVER SIMS CRK

✓

The bridge referenced herein was inventoried by the Maryland State Highway Administration as part of the Historic Bridge Inventory, and SHA provided the Trust with eligibility determinations in February 2001. The Trust accepted the Historic Bridge Inventory on April 3, 2001. The bridge received the following determination of eligibility.

MHT No. CARR-156

SHA Bridge No. CL-241 Bridge name Pearre Road over Sams Creek

LOCATION:

Street/Road name and number [facility carried] Pearre Road

City/town New Windsor Vicinity X

County Carroll

This bridge projects over: Road Railway Water X Land

Ownership: State County X Municipal Other

HISTORIC STATUS:

Is bridge located within a designated historic district? Yes No X
National Register-listed district X National Register-determined-eligible district
Locally-designated district Other

Name of district

BRIDGE TYPE:

Timber Bridge :
Beam Bridge Truss -Covered Trestle Timber-And-Concrete

Stone Arch Bridge

Metal Truss Bridge X

Movable Bridge :
Swing Bascule Single Leaf Bascule Multiple Leaf
Vertical Lift Retractable Pontoon

Metal Girder :
Rolled Girder Rolled Girder Concrete Encased
Plate Girder Plate Girder Concrete Encased

Metal Suspension

Metal Arch

Metal Cantilever

Concrete :
Concrete Arch Concrete Slab Concrete Beam Rigid Frame

Other Type Name

DESCRIPTION:

Describe Setting:

Bridge No. CL-241, built in 1908, carries Pearre Road over Sams Creek on the Carroll County - Frederick County border. The bridge is oriented in the east-west direction, while the creek flows north to south. The bridge is located in a rural wooded area directly behind the nineteenth-century McKinstry mill, in the Hopewell National Register District.

Describe Superstructure and Substructure:

The structure is a single-lane, single-span, steel Warren pony truss carrying two-way traffic. The 63'-0" span is comprised of four panels measuring 15'-9" each. The top chord is a built up member of face to face channels with a top cover plate. The verticals and diagonals are all made with two angles connected with batten plates and rivets. The verticals stiffen the diagonals that define the Warren truss. The bottom chord is constructed with two angles connected with batten plates also. The deck system consists of I-shaped stringers with timber cross planks all supported by I-shaped floorbeams at the panel points. The floorbeams are suspended from the vertical members. All joints are connected by gusset plates and rivets. The abutments are constructed of stone with concrete parging. Stone wingwalls flank the corners of each abutment.

Discuss Major Alterations:

In 1989, the original timber planks, floorbeams, and stringers were all replaced. The original truss still remains.

HISTORY:

WHEN was bridge built (actual date or date range) 1908

This date is: Actual Estimated

Source of date: Plaque Design Plans County bridge files/inspection form

Other (specify) State inventory form

WHY was bridge built? To provide a reliable crossing of Pearre Road over Sams Creek to meet local transportation needs.

WHO was the designer _____

WHO was the builder York Bridge Company - builder and/or designer

WHY was bridge altered? [check N/A if not applicable] Structural needs/ safety

Was bridge built as part of organized bridge-building campaign? Yes No

SURVEYOR/HISTORIAN ANALYSIS:

This bridge may have National Register significance for its association with:

A - Events B- Person
 C- Engineering/architectural character

Was bridge constructed in response to significant events in Maryland or local history? No Yes
If yes, what event?

This bridge was one of a large number of metal truss bridges erected in Maryland in the late nineteenth and early twentieth centuries. These bridges, which were stronger and more reliable than the majority of their predecessors, were part of a major advance in bridge technology in Maryland and throughout the nation in the third quarter of the nineteenth century.

When the bridge was built and/or given a major alteration, did it have a significant impact on the growth & development of the area? No Yes X **If yes, what impact?**

Because of their solidity, metal truss bridges such as the Pearre Road bridge provided reliable crossings, largely free from the dangers of floods and other disasters that regularly destroyed many of their predecessors. By assuring travelers that Pearre Road could be safely and reliably passed throughout the year, this bridge promoted small-scale residential, commercial, agricultural, and industrial development along the road and other thoroughfares that fed into it. Though their impacts were quite localized, bridges such as this, taken *en masse*, were an important factor in the development of rural areas throughout the state.

Is the bridge located in an area which may be eligible for historic designation? No Yes
Would the bridge add to or detract from historic & visual character of the possible district?

Is the bridge a significant example of its type? No Yes X **If yes, why?**

Between 1840 and the Civil War, under the impetus of a rapidly expanding railroad system, the majority of early American metal truss bridge forms were patented and introduced. In Maryland, the earliest metal truss bridges carried rail lines, which required their great strength and reliability. From the War through the end of the century, metal truss technology was improved, steel began to replace iron, and the use of trusses was expanded to carry roads as well as rail lines.

Numerous metal truss bridges were erected in Baltimore, the original hub of the metal truss in the state, from the 1850s through the 1880s. From Baltimore, the use of the metal truss spread out to other parts of the state, particularly the Piedmont and Appalachian Plateau. Many bridge and iron works were established in the eastern United States to design and fabricate truss members, which were then shipped to sites in Maryland and elsewhere to be erected. More than 15 different bridge companies located in Maryland, Ohio, Pennsylvania, New York, Virginia, and Indiana are known to have shipped metal truss bridges to sites throughout Maryland. Bridges were first fabricated in Maryland, and shipped to sites within the state and beyond, by the companies of seminal bridge designer Wendel Bollman.

Early in the twentieth century, concrete bridges began to compete with metal truss bridges throughout the state at small to moderate crossings. With the development of uniform standards for concrete bridges by the State Roads Commission in the 1910s, the construction of smaller metal truss bridges significantly declined throughout the state. The metal truss still remained the bridge of choice for large crossings, however. In the 1920s, heavier members began to be used at these bridges. Reflecting even heavier load requirements and increased lengths, metal truss bridges erected in the state in the 1930s and 1940s were heavy and solid, rather than light and delicate like their late-nineteenth- and early-twentieth-century predecessors.

British engineers James Warren and Willoughby Monzoni patented the Warren truss bridge in 1846. The form originally was a series of equilateral triangles in which the diagonals carried the tensile and compressive forces. Subsequent verticals added to the form served only to brace the triangular web system between the parallel top and bottom chords. The Warren truss was built throughout the country from the middle of the nineteenth well into the twentieth century. Judging from the few surviving Warren truss bridges in Maryland, however, it was used in a very limited fashion in the state. Two examples of the type in the state are bridges A-111 (c.1910) in Allegany County and CL-241 (1908) in Carroll County.

The bridge's use of a pony truss--a truss which has no lateral bracing connecting the top chords of its superstructure--is unusual in the state. Pony trusses probably comprise no more than about 20 percent of Maryland's metal truss bridges.

This bridge was erected during one of the three key periods (1840-1860, 1860-1900, and 1900-1960) of bridge construction in Maryland. Built in 1908, it falls within the period 1900-1960. During this era, metal truss highway bridges became increasingly standardized. Also during this period, smaller and moderate length trusses were gradually replaced by reinforced concrete structures, and the modern metal girder bridge, which could easily be widened, replaced the metal truss bridge at all but the largest

approaches and crossings. Built early in the century, it is characterized by relatively delicate members, rather the heavy solid members that characterize its successors.

Does bridge retain integrity [in terms of National Register] of important elements described in Context Addendum? No ___ Yes X **If no, why?**

Is bridge a significant example of work of manufacturer, designer and/or engineer? No ___ Yes X
If yes, why?

In the late nineteenth and early twentieth centuries, numerous metal truss bridge fabricating companies sprang up around the country that shipped bridge components to crossings for assembly on site. Among them was the York Bridge Company of York, Pennsylvania, which fabricated Pratt, Warren, and Parker trusses erected in Maryland in the early twentieth century. These included bridges CL-227 (1911) and CL-241 (1908) in Carroll County and F-407 (1914) and F-506 (1908) in Frederick County.

Should bridge be given further study before significance analysis is made? No X Yes ___

It is believed that no further evaluation is necessary to determine the eligibility of this bridge for listing in the National Register. However, additional research, which could be conducted as part of any future National Register nomination prepared for the bridge, might provide further information about its history and environs.

INDIVIDUAL PROPERTY/DISTRICT
MARYLAND HISTORICAL TRUST
INTERNAL NR-ELIGIBILITY REVIEW FORM

Property/District Name: Pearre Road Bridge Survey Number: CARR-156

Project: Rehabilitation of Pearre Road Bridge Agency: FHWA/Carroll County

Site visit by MHT Staff: no yes Name _____ Date _____

Eligibility recommended Eligibility not recommended

Criteria: A B C D Considerations: A B C D E F G None

Justification for decision: (Use continuation sheet if necessary and attach map)

Under Criteria A, the Pearre Road Bridge derives its significance from its association with the development of transportation in Carroll County. Metal truss bridges represent an important step in engineering design and a uniquely American achievement, the result of intensive experimentation in the 19th century. Relatively cheap and easy to build, these bridges were constructed in large numbers throughout the state in the late 19th and early 20th centuries. Because of their solidity, metal truss bridges such as the Pearre Road Bridge provided reliable crossings and promoted development. Although their impacts were quite localized, bridges such as this were an important factor in the development of rural areas throughout the state, when considered as a whole. Carroll County undoubtedly had scores of such bridges; however, as technology and use requirements have changed, they have been replaced at an increasing rate. According to a recently completed inventory of historic metal truss bridges, only two remain on public roads in Carroll County. The other metal truss, Mumma Ford Road over Monocacy Creek (CARR-1) has been substantially altered by the insertion of a modern arch truss system.

The Pearre Road Bridge is significant under Criterion C as one of only a few surviving Warren truss bridges in Maryland. Built in 1908, it is characterized by relatively delicate members, as compared to the rather heavy members that characterize later 20th century bridges. Of particular note is the retention of the plaque giving manufacturer and date. The Pearre Road Bridge was manufactured by the York Bridge Company, a major source of metal truss bridges in Maryland in the first decades of the 20th century.

The Pearre Road Bridge has been determined eligible by the Bridge Review Committee, composed of State Highway Administration and Maryland Historical Trust Staff, which is currently evaluating all historic highway bridges in Maryland. In addition, though not specifically mentioned in the National Register form, the bridge could be considered a contributing resource in the National Register listed property known as Hopewell (F-8-130; F-8-131; F-8-132; and, CARR-150), which encompasses over 257 acres in Frederick and Carroll Counties.

CARR-156
WARREN TRUSS BRIDGE
New Windsor Vicinity
Private

1908

Built in 1908, this Warren steel truss bridge spans 50-70 feet across Little Pipe Creek, which runs into the Monocacy River. All diagonal and vertical members are of open-work steel, and crossing is of wood planks. Built by the Yorkbridge Company of York, Pennsylvania, it is a reminder of the late 19th century and early 20th century structures that dotted the American landscape. An interesting note is that it divides Carroll and Frederick Counties for it lies over that natural boundary.

DESCRIBE THE PRESENT AND ORIGINAL (IF KNOWN) PHYSICAL APPEARANCE

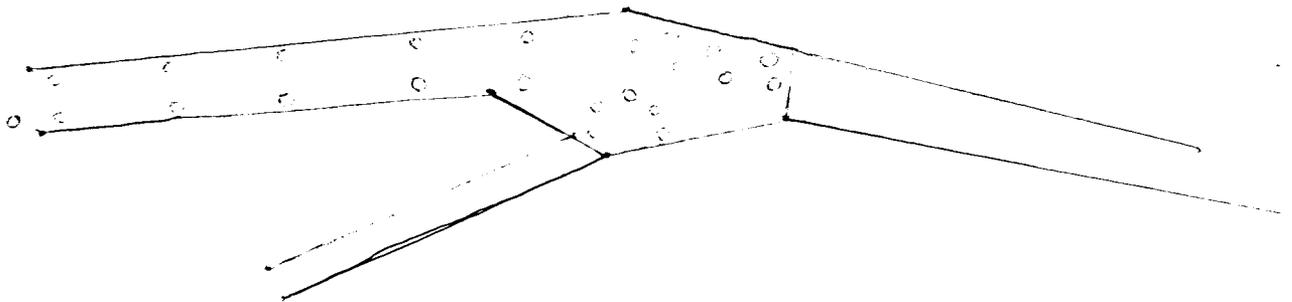

This steel truss bridge located directly behind McKinstry Mill was built by the York Bridge Company, York, Pennsylvania in 1908. The structure is built over Little Pipe Creek which is a natural border of Carroll and Frederick Counties. The border is in the north/west midsection of Carroll County. Little Pipe runs into the Monocacy River.

The bridge is triangular in outline, but does not have true equilateral triangles; therefore, it not a "true" Warren truss type. The four triangles are supported by vertical members to stiffen the structure. The end joints appear to be riveted:

Along bottom half of each half of open-work topless bridge runs lattice-work of verticals made of steel. Apparently, this is simply used for safety precautions as a guard rail.

Vertical and diagonal members are of same steel construction and size. Entire bridge is steel, except for wood crossing. Approximately 50-70 feet in length.
