Utica Bridge
Utica
Public

C. 1860

The Utica covered bridge is a single lane twin span Burr arch truss bridge which crosses Fishing Creek near Utica. The wood bridge, constructed of large hand hewn members, is a combination of the wooden arch and multiple post truss pattern, called a Burr Truss. The bridge sits on replaced cement and stone abutments and is 101 feet long approximately twenty feet wide. Small painted advertisements of local merchants are still visible on the interior rafters of the bridge.

The Utica Bridge originally spanned the Monocacy in the current location of the Devilbiss Bridge, but was badly damaged during the 1889 flood. The surviving half of the bridge was disassembled and moved by wagon to Utica and reassembled over Fishing Creek.

The Utica Bridge has a Burr truss, named after Theadon Burr, who first used the design in the early part of the 19th century and patented it in 1817.

BUILDER/ARCHITECT

STATEMENT OF SIGNIFICANCE

The Roddy Road, Loys Station and Utica Bridges are three of only eight remaining covered bridges in the State of Maryland. At least fifty-two such structures once graced the landscape of the state; but storms, fires and progress have claimed almost all of them. Preservation of the remaining structures as examples of nineteenth century bridge engineering techniques is extremely important to the history of Frederick County and the State of Maryland.

According to Richard Allen in Covered Bridges of the Middle Atlantic States, the building of covered bridges in Maryland was limited to the western and central counties, while the limestone counties of far western Maryland erected stone bridges instead. Covered wooden bridges were present on many of the major highways, including U.S. 40 and the Jefferson and Buckeystown Pikes in Frederick County. Until the introduction of the steel truss bridge in the mid-nineteenth century, most of the crossings in the county were wood truss structures often covered for protection from the elements. At one time as many as five wooden bridges crossed the Monocacy River. In the summer of 1889 the Johnstown Flood destroyed most of these.

The three covered bridges in Frederick County are closely related in historical and architectural theme. All three are wooden covered bridges crossing small streams in agricultural settings. They are located in close proximity to each other in the northern part of the county. All were built in the second half of the nineteenth century and have been in continuous use since that time.

The three bridges provide a good comparative study of wood bridge truss techniques, as each displays a different truss design. The Utica Bridge has a Burr truss, named after Theodore Burr, who first used the design in 1817 and patented it in 1817. The Roddy Road Bridge is constructed of the single king post design, and the Loys Station Bridge is a multiple king post structure.

DESCRIBE THE PRESENT AND ORIGINAL (IF KNOWN) PHYSICAL APPEARANCE

The Roddy Road Covered Bridge is a small, one-lane, single span wood truss covered bridge which crosses Owen's Creek on Roddy Road north of Thurmont in Frederick County, Maryland.

The wood bridge consists of a single king post truss forty feet in length resting on five steel stringers and two stone abutments. The deck is wooden planking, the entire structure is covered with red beveled German clapboarding, and is finished by a tin gabled roof.

The Loys Station Bridge is a one-lane, twin span, multiple king post, wood truss covered bridge which crosses Owen's Creek above Creagerstown on Old Frederick Road in Frederick County, Maryland. The wood bridge is ninety feet in length and rests on two stone abutments. The planking and clapboarding are identical to the Roddy Road Bridge.

The Utica Covered Bridge is a one-lane, twin span Burr arch truss bridge which crosses Fishing Creek on Utica Road in Utica, Frederick County, Maryland. The wood bridge, constructed of large hand hewn members, is a combination of the wooden arch and a multiple post truss pattern, called a Burr truss. The bridge, which is 101 feet in length, crosses the creek into two spans. Small painted advertisements of local merchants are still visible on the interior rafters of the bridge. The decking and clapboarding are identical to the other two structures.

The Utica Bridge originally spanned the Monocacy in the current location of the Devilbiss Bridge, but was badly damaged during the 1889 flood. The surviving half of the bridge was disassembled and moved by wagon to Utica and reassembled over Fishing Creek.

Taken from letter of Sept. 19, 1977 to Pamela James from Cherilyn Widell:

"I arrived at the date of c. 1860 for the bridges since an undocumented local source has dated the Roddy Road Bridge to 1856, the Utica Bridge is shown spanning the Monocacy on Devilbiss Road on the 1873 Titus Atlas, and a newspaper article in the Frederick Examiner dated September 13, 1854, states that iron was now being used in other parts of the country for bridge construction and soon would be used in Frederick County. By the 1870's steel truss bridges were being built instead of wood bridges as evidenced by remaining examples throughout the county.

. . . there have been numerous maintenance alterations to all three bridges. However, the Frederick County Roads Department does not keep a maintenance record of any of the bridges. The State Roads Department does maintain a computer record of the Loys Station Bridge (because it is on a federally funded road). . . According to this record the bridge was "reconstructed" in 1930 although it is unknown what this entailed. A resident who lives adjacent to the Roddy Road bridge claims he helped install the steel stringers in the 1920's. Most of the clapboarding on all three bridges has been replaced according to the County Roads Department.
