DESCRIBE THE PRESENT AND ORIGINAL (IF KNOWN) PHYSICAL APPEARANCE

"Small Reward" consists of three clapboard-covered frame sections, one of which is modern. A one story, late 18th century house to the east adjoins a two story c. 1830 addition to the west. Both gable roofs run east-west. The modern addition to the south encloses two doors, one in the west bay of the 18th century house and one in the east bay of the 1830's house. Its gable roof runs north-south.

The earliest section measures one bay deep by three bays long. Two gabled dormers containing 6/6 sash appear in either side of the roof. Three 6/6 windows light the north side. The west window was once a door. The south side includes a door to the west and two 6/6 windows to the east. Louvered shutters flank each window. The brick foundation is pierced by small windows, lighting a modern cellar. A modern exterior chimney rises against the east gable end where a previous chimney heated either floor.

The floor plan of a single parlor on the east adjoining the western stair hall is reflected in the loft, with the addition of a tiny chamber at the north end of the hall. A door between the hall and the parlor opens at the north end of these rooms. At the stair landing the south roof slope reduces headroom to a minimum.

Little datable woodwork remains. The first floor architraves match those of the addition. The stair includes bulbous-curved step ends, simple rectangular balusters, a hand rail which is mushroom-shaped in cross section, and a square fluted newel post topped by a flat cap.

Visibility of the eaves was limited but their construction appeared to include a flat false plate. The collars are half-lapped and double-nailed with wrought nails. The 3½" x 4" rafters are half-lapped at their apex and are held by an unusual combination of one peg and one wrought nail. The attic as well as the first floor framing is composed of fairly heavy, hewn and rough-sawn members.

The 1830's house is three bays wide by four bays deep. A 6/6 window lights either gable end in the attic. On the north side, a door in the east bay adjoins two 9/6 windows. Three 6/6 windows light the second floor. The fenestration on the south side is the same except for the second floor east door leading to the modern section. These windows are flanked by louvered shutters. On the first floor west gable end the four bays, from north to south, contain a 9/6 window, an exterior chimney, another 9/6 window, and another exterior chimney.

STATEMENT OF SIGNIFICANCE

This two-part house documents the transition, through the Federal period, from the vernacular 18th century house to the technically advanced mid-19th century house. The earliest part of Small Reward utilizes the then-new side hall plan rather than the older two room, hall and parlor plan, but without improving beyond its heavy framing and small size. At the stair landing the problem of the grander stair in the one-story house is painfully obvious. The tiny extra room shows the need and desire for an increase in private space. The 1830's house shows a sophisticated, enlarged plan, but by the odd spacing of the parlors retains its country, experimental eccentricity. Houses similar to Small Reward include the Stinnett Farm (CT-28) and the Baden-Anderson House (CT-27).

Small Reward was recently saved from ruin by Dr. Page Jett and his son and daughter-in-law, Mr. and Mrs. Robert Page Jett. Their renovations include a new chimney at the east end of the first house and a two-story gabled addition projecting southward from the junction of the two houses.

Robert S. Harrison obtained this property in the estate settlement of his father Robert Harrison in 1867. Further research was halted by the lack of information before the 1882 courthouse fire. The house is believed to stand on the 1688 land grant of 111 acres to Richard Smith, "Small Reward".

The two 5:1 common bond chimneys rise two stories before their untiled shoulders step in to a narrower stack. Their faces also step in several courses at this level. Two-course water tables across the front of the chimney bases do not continue around the sides. A brick foundation underpins the house.

The stair halls of both houses run side by side. They are joined by a door at the north end. The original shiplapped, rough-sawn cypress clapboards of the 18th century house are preserved by the 1880's addition. They are visible under the 18th century stair.

Two parlors on the west adjoin the 1830's stair hall. This plan is repeated upstairs, again with a small chamber included at the north end of the hall. A small enclosed stair leads to the attic. On the first floor, the larger north parlor includes the two west windows.

Fortunately the exquisite woodwork of this part of Small Reward survives intact. Each door comprises six shallow panels. A wooden box lock with incomplete mechanism is located on the inside of the attic door.

The stair's step ends start with a small circle unfurling into a shallow curve. The compact newel cap, rounded with flat sides, rises as one piece to start the banister. The slender rounded newel post contains scored and beaded bands before swelling gently to its base. The balusters are simple rectangles.

First-floor architraves commence with a small Greek ovolo and astragal dropping down two stepped flat sections to a beaded edge. Various sections of this wide molding appear in other woodwork. The chair rail, which runs under the windows to form their sills, and the baseboards are composed of only the stepped and beaded portion; the second floor architraves comprise only the Greek ovolo; and the second floor fireplace is framed by the Greek ovolo and astragal molding.

In addition to the simple second floor mantel, elaborate mantels survive in the two parlors. The larger north parlor's mantel includes diamond-bordered panels; a deep, sharply cut Greek ovolo shelf; and pilasters, each of whose two vertically running quirk ogee and astragal molding strips flank a central raised, double-beaded molding. The simpler mantel is similar, but lacks the panels.

Although the uneven composition of the west wall of the 1830's house raises the suspicion of more than one building period, the entire framing under the first floor was observed to be of only one build. The thin flat joists were rough sawn on their long edges and hewn on their short edges. They lap over, without mortising into, the sills.

All the nails used in the attic construction were machine-cut with only slightly less than perfect heads. These nails hold gable-end studs into the rafters, and attach the wide floorboards to the joists. Because of the varied positions of empty mortises the rafters appear to have been re-used, perhaps from the steeply sloping roof of a one-story building. Their apex is now simply butted and nailed; their feet rest on the floorboards, which in effect serve as informal flat false plates.

Meat House

A 10' x 12' gable-roofed outbuilding of unusual construction sits to the south of the southeast corner of the house. Its single batten door is located at the east end of the north side. The building rests on brick piers. Much of its rough-sawn butted vertical siding and wide plank flooring appears to be original. All of the building's framing members are hewn and rough-sawn.

Two ceiling joists span the interior, lapped over and pegged into the side plates. These joists carry flat false plates, on which the rafter feet rest. The rafters are mortised, tenoned, and pegged at their apex. Four sets of collar beams, one at either end and two across the interior, are composed of three tiers each. These "collars" are half-lapped over and triple-nailed into the rafters with machine-cut nails whose flat heads have slightly irregular edges.

This outbuilding's wall construction is a type I have not observed elsewhere. Four large corner posts receive series of mortised 4" x 4" square "side rails" spaced 4" apart. This still leaves room along the corner posts for a pair of mortise-tenon-pegged angle braces along each side, diagonally crossing these so-called "side-rails" across their interior faces but not attaching to them. Because of this 4" spacing, the "rails" do not truly represent log or plank construction, although they may have evolved from those types. This heavy "horizontal" rather than vertical, or stud, framing is ideal for receiving the vertical planks which were nailed to it. Was this arrangement perhaps part of the transition from horizontally to vertically sided barns?

According to Dr. Page C. Jett, this building was used for hanging meats after they had been smoked. The meat house appears to be contemporary with the 1830's house.

Tobacco Barn

The original 24' x 32' section of this c. 1830's tobacco barn is now shedded on all four sides. The framing contains many re-used and replacement parts. The original members are hewn and rough-sawn. Tiers of horizontal rails, four on either side and three on either end, are half-lapped over posts and nailed with wrought spikes. Heavy angle braces are mortised and pegged into the corner posts and sills.

The eaves construction includes a rectangular false plate. Three tiers of collar beams are lapped over and nailed into the rafters, which appear to be mortise-tenon-pegged together.

A tobacco prize is located under the east shed. Its mechanical works are cast iron, while its frame consists of circular-sawn wooden members mortise-tenon-pegged together.

Other Sites

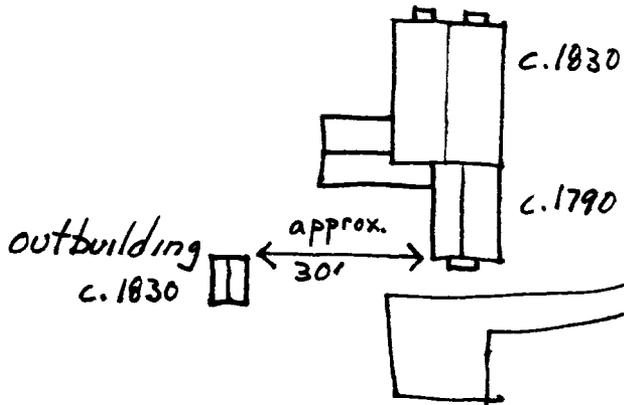

A cemetery with fieldstone headstones, and the site of a saw mill which operated into the early 20th century, exist on the property.
