

The Farm.

Manure.

Notwithstanding the great and indispensable system of gathering and preserving manure on the farm, which we have in these articles recommended, if the land is subjected to the merciless system of plowing and grain cropping so generally practiced by farmers, it will constantly run down, and fail to produce remunerative crops, even though the manure gathered on the farm be supplemented by purchased fertilizers.

The Curculio.

A correspondent who has been studying the habits of this destructive insect gives the public the benefit of his investigations and experiments. The curculio is a small beetle similar to the pea beetle, which conceals itself on the ground at night, ascends the trunk of the tree at night and punctures the green fruit with an instrument like the sword of the locust attached to its ovipositor and lays an egg in each puncture, which hatches the worm that destroys the fruit.
