DAIRY NOTES.

J. Wilkinson, Lundscape Gardener and Rural Architect, Baltimore, in a letter giving some account of a visit to his native State New York, published in the American Farmer, for August, says:

"I found the most marked prosperity in ble, drains are opened and the best part of the dairy districts. In central N. Y. where, 17 to 20 years since, a large majority of the the manure is allowed to flow off into uncultivated places. A little foresight, farms were heavily mortgaged, now very a little extra expense in cellar-digging few of them are suffering from this very unpleasant incumbrance, and the fertility at the start, in providing liquid manure and productiveness of the land is greatly cisterns, in carrying off or utilizing the improved, as also the architectural characo water from roofs, and in using muck ter of the dwellings, and also in some in- instead of patent fertilizers, would revolustances the farm barns.

Instances of this sort are becoming less I observed that many of the large dairy farmers are also breeding quite extensively, an excellent quality of horses. Very little are, every neighborhood has its abundant grain is grown in the best dairy districts, samples. It is one of the reproaches of but wheat refuse, the products of the immense flouring mills of the West, is used for cow feed in large quantities; this, added to the entire products of the soil, minus the cheese and butter extracted, rapidly increases fertility. The average price of cows in the dairy district is about \$50. I examined a large number of them and found them very low in the scale of test by Mr. Guenon's system of ascertaining the lacteal qualities, and I am satisfied might have more than doubled, in the past grow tall, cattle don't think so. They 8 or 10 years had the calves of both sexes been carefully and intelligently selected by the marks designated by Guenon."

From the same number of the Farmer we extract the following:

ASSOCIATED BUTTER DAIRY. "We recently published from a correspondent of our own, a description of the more expeditiously in straight lines .-Butter Dairies of N. York. The import- Besides, these division fences are a great ance we attach to the introduction of these hindrance in passing from one part of the institutions, and the hope of seeing them farm to another. Bars must be let down, common in this and the States South of us, or gates must be opened, and we often can't must be our apology for so frequently alluding to the subject.

A convention met at Mayville, Chautauqua county, N. Y., on 23d April, for the these division fences, that the mowing making of butter, similar to those so successfully established for the production of Cheese. We learn from a correspondent of the Country Gentleman that Mr. O. C. must be grazed. We would never permit Blodgett, of that county, delivered a short a hoof on the meadows, except to take off address, stating the reasons why the meeting had been called and necessity of an duce two crops of grass, then mow two association. Among other reasons, he said crops. The meadows will be all the better that in this county alone there are in round for not being poached up in the Fall by numbers 50,000 cows; that in the adjoining the tread of cattle, and certainly the close counties of Pennsylvania, which would grazing of them is a damage. If the pasjoin the organization, there are 200,000 cows; that estimating for each 25 cows, \$10,000 invested in land and improvements, the total value of the property invested in the dairy business in the territory named is \$100,000,000. He said that cheese-makers are far in advance of butter-makers, producing a more uniform atticle and getting a better average market price, but that butter makers can attain the same success. At least \$20,000 will be invested in Chautauqua county alone, this year, for new and comparatively untried improvements (so claimed) in machinery for the dairy .-But a butter-maker's association, a meeting of dairymen once a month, will enable us by the aid of free discussion, to be much less liable to loss from patented ma chinery. One thing still to be learned, is, how to keep the temperature of the milk down in hot weather, so as to get the greatest possible amount of cream-and only an interchange of opinions and comparison of experiments will give us the required information. He said the standard of our butter should be brought up to the quality is filled with milk, and is placed with the of the very best. He defined a dairyman cover off, in a stream of spring water, till as "a man, with the knowledge of nearly the temperature of the milk is very nearly all the laws of nature added." There are the same as that of the water. The milk two ways of attaining a knowledge of the is not stirred while the cooling process is best methods of making butter-one by going on. Most milk farmers have a coolforming an association for free-discussion, ing vat of a capacity four times as large as the other by having an experimental farm | the milk vessels that are placed in it. The devoted to dairying at the expense of the cans are placed on slats near the bottom,

first is only the practicable method. Mr. Blodgett's address was well received the milk flows of from the top. The water and, in accordance with his suggestion, an should stand an inch over the body of the association was organized under the name can. With good conveniences, milk in of the "Western New York Butter-Mak. ordinary sized cans, may be cooled in about ers' Association and Farmers' Club."

MUCK AS AN ABSORBENT.

This subject is thus discussed by the Country Gentleman : .:

dairymen now unite in the opinion that "The Michigan Farmer devotes considerable space to prove that farmers cannot milk is injured for any perpose by being afford to use wheat straw as an absorbent cooled too suddenly, as by the use of ice or the employment of patent coolers. They in preserving liquid manure, that the amalso agree that warm milk should not be monia in urine can be retained just as well mixed with that which is cold, as is freby dilutiuting with an equal bulk of water. and that nearly as cheap are earth, loam quently done by pouring milk into a can and soda.

We will not stop to discuss the question of the cheapness of adding an equal bulk of water to urine or liquid manure in order to fix the ammonia, but we allude to the matter to express our surprise that in discussing the subject the authority from which it quotes should not think of swamp muck. Where it can be had it is one of the best of all absorbents, besides having merits of its own independent of its qualiities in that direction. On light or sandy soils it is especially valuable, as it holds moisture, tends to make the soil heavier, besides furnishing plant food from the mass of decaying vegetable matter of which it is composed. To do the best service as an absorbent, it ought to be made as dry as possible before using, because like a dry sponge, it will then retain so much more of the liquid manure into which it is to be placed. Of course its power to absorb must be greatly limited if it is put into the manure heap full of cold, swamp water, and sour with the impregnations of per haps hundreds of years; but it should be first placed where its moisture can evaporate, and where the effect of a dry atmosphere, freezing, &c., will cause it to crumble. Thorough freezing for one or two winters, and a dry exposure afterward, will thoroughly pulverise it, and it is then in excellent condition not only for an absorbent, but for direct application to many plants, particularly grapes and overgreens.

As a deoderizer, dry muck has probably no superior. In this condition it is fur lighter to handle than dry earth, or loam, or sods, its absorbing capacity is greater, and it will hold its moisture better when spread for fertilizing. Its occasional application will free manure cellars or privies of every foul odor 'and 'fix the escaping ammonia, until by the increase of excrements and urine another application is needed. No barn cellar need injure stock that the latter is an unwholesome paste by its foul vapors where muck is used lib- before the stalks are done, and if they are erally. Mixed with fresh horse manure in thrown away either before or a tor cook the right proportions (which experiments ing them it is waste. The ster is of cabbawill soon test) a moderate instead of a ges that are crisp should have the soft burning fermentation will go on, which green part cut from them to be cooked by will soon place the pile in the best possible itself; the stem when stripped from the condition, improving all the ingredients - green be tied in small burdles, cooked for There will be little odor in a stable, and no from twenty to twenty-five minutes in waste of ammonia, where plenty of dry plenty of boiling water, salt, and a little muck is so placed that the urine and drop- soda, and be served with butter sauce over pings of stock can fall upon it. It does them. Thou a dish of seal ale is not more not make as clean bedding as sawdust or delicious. These cabbage stems may be sand, because when absorbing moisture called "chardoons," and will gratify the there is generally clay enough in it to make palates of all who taste U em thus cooked. it stick to the hair of horses and cattle, Young spring cabbages, of course do not but the other purposes of bedding it meets need this treatment. - Re change.
